Preservation of Live Topiaries
Naturally preserved using a simple glycerin solution in combination with the controlled heat and humidity of one of our preservation rooms. The glycerin used is food grade (kosher) and totally safe for you and your pets.

During the preservation process heat and low humidity dehydrates the plants and flowers, forcing them the "drink" the glycerin solution in an effort to rehydrate. The glycerin solution then solidifies in the plant and preserves it for all time.

During this process, FDA approved food grade dyes can are added to enhance a plants natural colors or even change the natural colors - as is the case for many or our floral elements.

MAINTENANCE
• There are actually few things you need to do to keep your topiary plants looking beautiful for years to come:
  • DO NOT water your plant.
  • DO NOT put your plant in direct sunlight.
  • It is not recommended that you place your plant outdoors (no shelter) as this may reduce its lifespan and make it vulnerable to insect, deer and jealous neighbors.
  • DO occasionally dust your plant with a light feather duster. You may also use canned air to spray off accumulated dust while keeping the tip at least 2 inches from the plant.
  • DO put your plant in a prominent part of your home or office and show it to all that visit.

LIFESPAN
• The life of our products varies by type but you should expect the following:
  • Boxwood: 7+ Years
  • Junipers: 7+ Years
  • Bonasi: 7+ Years
  • Eucalyptus: 10+ Years
  • Palms: 7+ Years
