

### How to care for your Euonymus Topiary:

3" Clay Mini  
Euonymus Green

4" Clay Washpot  
Euonymus  
Variegated

4 1/4" Euonymus  
Standard Green

**WATERING:** Euonymus prefers to dry out slightly before being watered. Feel just under the surface of the soil often to determine when to water. Carefully pour water on the surface of the soil until some drains out the bottom. Do not allow your Euonymus Topiary to stand in water.

**LIGHT:** Euonymus prefers medium to bright light when placed indoors. Note that placement directly in a west or south facing window that receives full afternoon sun may be too much light and heat for your Euonymus Topiary and will require very frequent watering. Filtered light from these windows is perfect as is placement in a north or east facing window. Placement of your plant in a protected outdoor porch or patio is very beneficial as long as no direct afternoon sun is received. Move your Euonymus Topiary indoors if temperatures fall below freezing.

**FERTILIZER:** Fertilize perhaps monthly while the plant is actively growing following the manufacturer's instructions. Don't fertilize a stressed plant as this will further stress the plant's roots.

**PESTS:** Actively monitor your Euonymus for signs of insects or disease. If caught early, most pests can be removed by simply squishing, rinsing, wiping or minor pruning. The best preventive measure is to rinse the entire plant (not the soil) in cool water weekly. The act of rinsing or sprinkling the leaves regularly helps to keep them clean, green and free of insects. If an infestation does occur use an appropriate pesticide and follow the manufacturer's instructions.

**REPOTTING/TRIMMING:** Once your Euonymus Topiary has outgrown its pot, or just perhaps because it dries out too quickly to easily maintain, you may repot it into a slightly larger pot, being careful not to over- or under-water the plant to help promote new roots to form. Trim off excess growth to keep desired shape.
